Intro Information

This manual serves as a guide for users of the new web application simulation, developed by Landing Solutions for Panther Cloud Air. The purpose of this document is to provide a clear and comprehensive walkthrough of the application's major functions and features, allowing the client to visualize and interact with the system before it is deployed by the company. This manual includes sample screens and step-by-step instructions to help users navigate the application with ease.

Download Instructions

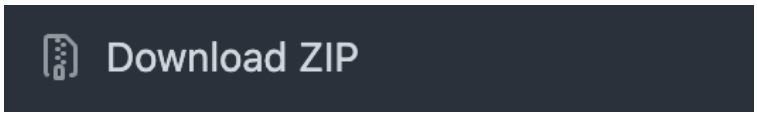
Github

1. Go to https://github.com/mangomonster5/CSC-4710-Capstone-Landing-Solutions
2. Click the green code dropdown button

   Figure #1

3. After the dropdown appears, click "Download ZIP"

   Figure #2

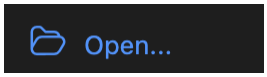
   


4. Unzip and remember where this folder is located

VS Code

1. **(Skip this step if you already have VS Code installed)**
   a. Download Visual Studio Code https://code.visualstudio.com/
2. Open Visual Studio Code
3. Find and click the open button

   Figure #3

4. Navigate to the same path you unzipped the folder at and open this folder in VS Code
5. Open a new terminal

Docker

1. **(Skip this step if you already have Docker Desktop installed)**
   a. Download Docker Desktop https://www.docker.com/products/docker-desktop/
2. In the terminal in VS Code run these commands
   a. This command builds an img in docker desktop
      i. docker build -t landing-solutions-dev .
   b. This command runs and builds hot loading the website

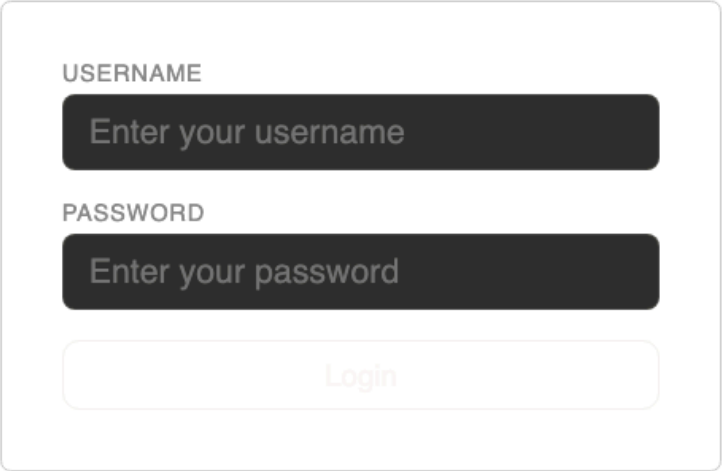
i. docker run -d \ -p 3000:3000 \ -v $(pwd):/app \ -v /app/node_modules \ --name landing-frontend \ landing-solutions-dev

c. Navigate to http://localhost:3000/

Quick Start Guide

Login Window

Figure #4

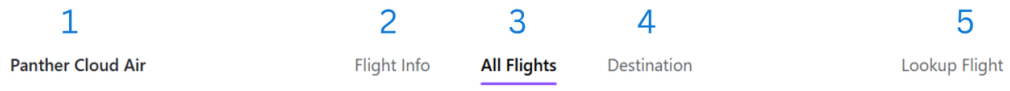


The username field will take inputs of letters, numbers, and special characters. Input your valid group ID (provided by Panther Cloud Air) before moving onto the next field.

The password field will also take inputs of letters, numbers, and special characters. It is case sensitive, so ensure you are putting in the password correctly. Input the valid assigned password (provided by Panther Cloud Air) and hit the ENTER key on your keyboard. If the information is correct, you will be granted access to the allotted screens you have privileges for.

Nav Bar

Figure #5



1 Company Name
2 Button to switch to flight specific information
3 Button to view all flight information
4 Button to view flight destination information
5 Button to search for flights

Employee Window

Flight information

Provisional Example: Flight CA1234 - Flight Details

<u>DEPARTURE - JFK (New York)</u>
Gate: B23
Scheduled Time: 8:00 AM EST
Boarding Begins: 7:30 AM
Doors Close: 7:45 AM
Taxi Time: 20 minutes (hub airport)

<u>IN-FLIGHT</u>
Takeoff Time: 8:20 AM EST
Cruise Speed: 680 km/h (80% of max)
Altitude: 35,000 ft
Wind Adjustment: -4.5%
Fuel Usage: 12,870 gallons

<u>ARRIVAL - LAX (Los Angeles)</u>
Landing Time: 10:50 AM PST
Gate: A15
Taxi Time: 17 minutes (hub airport)
Scheduled Arrival: 11:10 AM PST

<u>COST SUMMARY</u>

Fuel Cost: $79,626
JFK Fees (Takeoff): $2,000
LAX Fees (Landing): $2,000
Total Operating: $83,626
Revenue (75% load): $242,661
Profit: $159,035

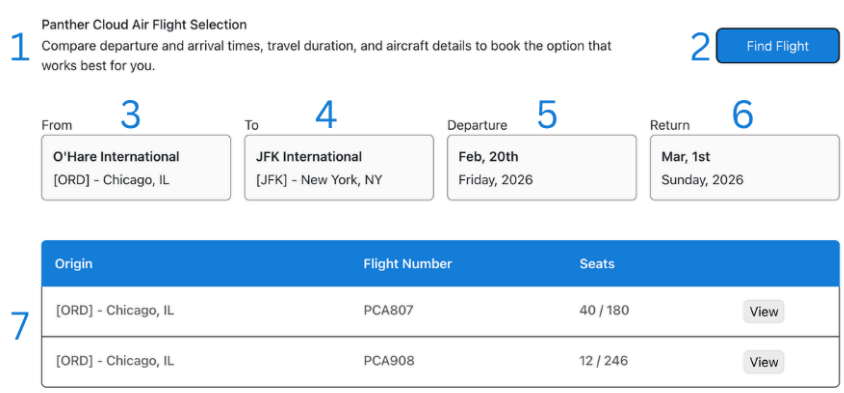
All Flights

Figure #6

1 Origin [Where the flights are coming from]
2 Time flight takes off
3 Number of the flight
4 The gate where the plane will be at
5 Status of the plane [Whether it arrived or if its on approach]

Flight Selection

Figure #7

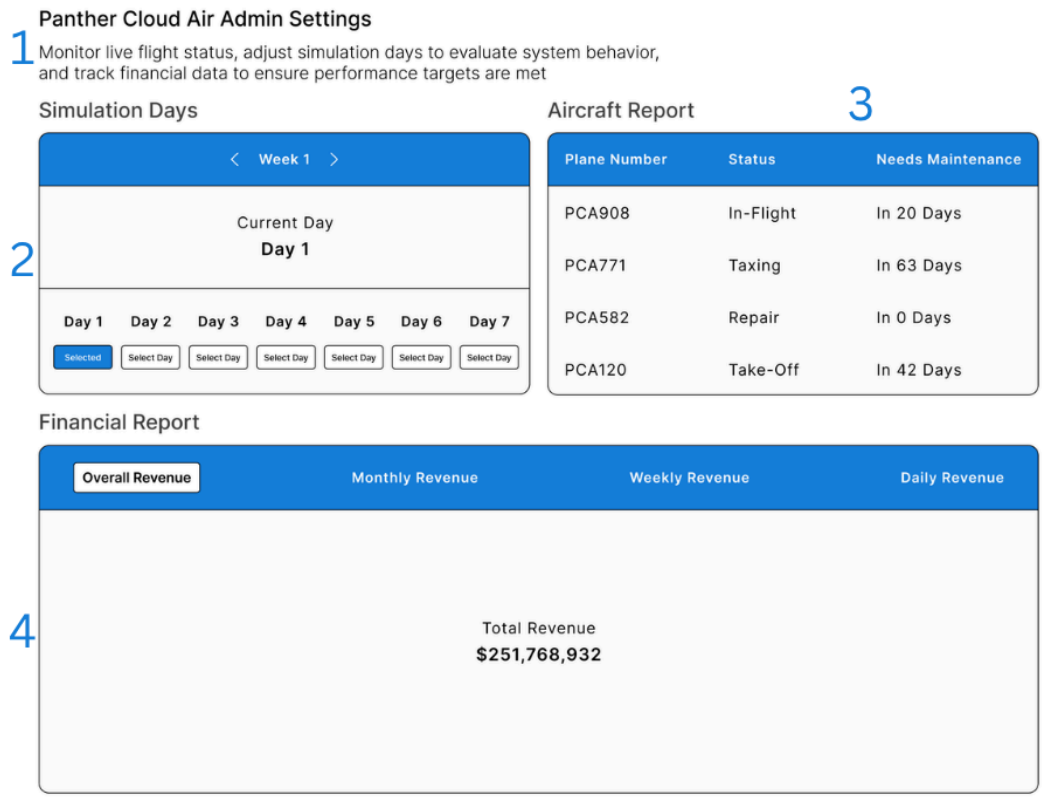


1 Description to help tell the user what section they are currently in
2 Button to submit the search with the values chosen below
3 User selection of what airport the flight will depart from
4 User selection of what airport the flight will arrive at

5 User selection of what date the flight will depart on
6 User selection of what date the flight will land on
7 Table display of all flights that match the user selections and will display flight specific information

Admin Window

Figure #8



1 Description to help tell the user what section they are currently in
2 Calender to tell you what day it is in the simulation
3 Plane report given to the admin that is organized by plane number and tells you
4 Financial report given to the admin that will filter based on the filter options

Error Handling

This section looks at common errors that may be encountered using Panther Cloud Air and how to resolve them. When a general error occurs, the system will display a message near the effect field or as a pop-up alert. This message will describe the issue and how to correct it. Here are some possible errors below:

Invalid Username or Password
A message displayed saying that the username or password is incorrect if the credentials entered don't match any of the accounts. The message will persist until a correct username and password are entered, with potential lock outs.

Flight Not Found
A message will display that says flight record not found, and it would prompt the user to verify the flight ID and try again

Invalid Input Format
A message would display an invalid input format which would be because the value isn't in the right format (for example, like an incorrect date format or text in a number field). The user would have to reenter the data in the correct format.

Data Load Error:
A message would be displayed that says they are unable to load data because of a database retrieval error. The solution to this could be refreshing the page or restarting the system.

Unexpected System Error
A message will display that says that an unexpected error has occurred. This could be because of an unhandled or unknown issue in the system. The best way to fix this would be to restart the system or retry whatever action has been done. If it still persists report the system to an administrator

Users looking to minimize errors should carefully review all error messages and ensure that all required fields are completed accurately before retrying an action. If errors continue to occur, users should contact an administrator or technical support for further assistance.
